

VTS Operator Tips

Creating Customized Navigation for VTS[®] Application Pages

VTS support an unlimited number of system pages. The following excerpt from the VTS Operator's Guide shows you how to easily navigate between the screens you use the most.

Display Manager Navigation Bar Tools

The navigation bar is located at the bottom of the Display Manager. It is used for navigating through the pages of your application.

The navigation bar includes the following navigation tools (from left to right):

Navigation Bar Tool	Description
Menu button	The Menu button, when clicked, displays a customized menu of the ages for your VTS application. Selecting a page from the menu opens that page.
Page Change buttons	The page change buttons (located to the right of the menu button) provide single-click access to different pages in the application. The page change buttons are customized according to the user that is logged on to the application. Note: Your application may not feature any page change buttons; however, you can use the Add To List and Remove From List buttons (described below) to add page change button to the navigation bar.
Add to List button	The Add To List button adds a page change button for the page currently being displayed to the page change button area.
Remove from List button	The Remove From List button deletes the page change button representing the currently displayed page from the page change button area.
Previous Page button	The Previous Page button displays the last page that was viewed. Additional clicks display pages from further and further back in the page history.
Next Page button	The Next Page button allows you to move forward through the page history. This feature is only available if you have first moved backward through the page history.
