

Visual Tag System 8.0

*Enhanced connectivity, graphics, fault-tolerant
Internet client connectivity*

Trihedral Engineering Limited is proud to announce the release of Version 8.0 of its flagship software package, Visual Tag System (VTS). This version incorporates important new features that extend the functionality and reliability of VTS in some obvious and some not so obvious ways.

Windows Vista™, XP, 2000, 2003 Server Compatible

VTS 8.0 users can take advantage of Vista's new features while maintaining compatibility with their existing operating systems.

New Drivers

In addition to our already impressive library of device drivers, VTS now includes the Siemens S7 Ethernet and DNP3 drivers in our out-of-the-box package, providing you with even more freedom when purchasing new hardware.

Other Important New Features

- Pop-up dialogs for increased visibility of high priority alarms
- Streamlined integration with wireless devices such as the BlackBerry™
- Direct calls to VTS historical databases from 3rd party reporting packages
- Realm Area Filtering available at the workstation level
- Balloon-style Tool Tips with headings and descriptions
- Enhanced window configuration options

Expanded Animation Interface

VTS 8.0 features expanded capabilities for animating numerous graphical parameters.

Values and expressions can now be used to change the color, size, horizontal & vertical movement, border size and texture of graphics, all without leaving the runtime environment or requiring scripting knowledge.

This allows you to create richly animated displays that provide clear and immediate feedback to operators.

Seamless Redundancy

Fault-tolerant performance is a core feature of VTS which supports multiple, redundant back-up servers.

VTS allows internet clients to automatically switch servers seamlessly without browser restart or user intervention, even remembering user session information.
